

Game Publishing Process from the Game Provider Perspective

Stages a Game Goes into the Publishing

Submitting a Game Publishing Request to BGaming Distribution Network

At this stage, the development team must provide the following artifacts for product analysis:

- GDD
- clickable prototype
- full game description

The review team at BGaming analyzes these materials to determine if the company is interested in releasing the game in their network.

If the decision is positive, the development team receives detailed feedback for game improvement and an agreement to include the game in our distribution network.

Preparing the Game for Publishing

During this stage, the game development team receives technical documentation on publishing API, requirements for game container preparation, game UI implementation, and marketing material requirements.

The result of this stage is the submission of the following artifacts to the publishing team:

- 2 Docker containers with game backend and frontend
- A set of game icons and backgrounds
- Game description
- Presentation on the game and its main features

Game Testing by the Publishing Team

In this stage, the publishing team conducts acceptance testing of the game, which includes a full functional test that BGaming performs before the game's release and a check of the game's mathematics to ensure it meets the stated parameters. All defects found at this stage are documented and sent to the game development team for correction.

A game is considered ready for release when all identified defects are corrected, and the acceptance test is passed. For the first game from a new game provider, a period of 2 months from the start of testing to the announcement of readiness for release should be anticipated. Based on our experience, this process significantly speeds up for subsequent games.

Game Release

At this stage, the game is installed in all necessary environments and activated for casino clients.

Game Readiness

The game provider submits a fully ready game in a release candidate state, assembled according to the technical documentation received from the business development team of the publishing department.

BGaming does not offer services for technical improvements of the game.

BGaming provides only consulting services, covering aspects such as reviewing and providing feedback on game mechanics, mathematics, and artistic components of the game.

Game Release Application

BGaming has a process where a game is announced for release 1.5 months before the intended release month.

For example, if a game is planned for release in September, it must be announced no later than July 15.

Release of First Games from a Game Provider

The release of the first games from a game provider is possible only after the first cycle of acceptance testing is completed, based on the criticality of found defects and the speed and quality with which the game provider corrects the defects.

For the first and second games, the following approach will be used:

1. First Game: Announced for release when the acceptance testing is fully passed or only defects with minimal priority remain uncorrected.
2. Second Game: Announced for release when Critical and Major defects are corrected, and the number of remaining Medium and lower defects allows the game provider to prepare a release candidate no later than 2 weeks before the release date.

The third and subsequent games can be announced for release at the moment the release candidate is handed over to the publishing team, provided that all remarks found in the first two games were promptly corrected and are absent in these games.

Responsibility for Release Delays

The game development team is fully responsible for release delays due to the technical unpreparedness of the game.

If the release delay is due to the development team, all subsequent release applications are only possible after a full cycle of testing, similar to the process for the first game from a new game provider.
